Idaho Perinatal Project

Perinatal Mood Disorders: Components of Care

This two-day course, taught by expert and engaging faculty, uses a thorough, evidence-based curriculum designed for psychiatrists, nurses, psychologists, social workers, mental health providers, childbirth professionals, social support providers, and anyone interested in building skills for assessment and treatment of perinatal mood disorders.

Upon completion of this course, the participant will be able to:
1. Identify the challenges faced when identifying and treating Perinatal Mood and Anxiety Disorders.
2. Describe the symptoms and understand the differential diagnosis of pre and postpartum depression, anxiety, panic disorder, OCD, PTSD, bipolar disorders, and psychosis.
3. Discuss psychopharmacology as it relates to pregnancy, postpartum, and lactation.
5. Assess for Perinatal Mood and Anxiety Disorders.
6. Identify treatment options for PMADs.
7. Discuss breastfeeding and PMADs.
8. Develop psychosocial and self-help treatment plans and also important psychotherapy techniques and alternative therapies.
9. Identify appropriate psychotherapy modalities.
10. Identify consequences of untreated Perinatal Mood and Anxiety Disorders.
11. Identify social support, legislative changes, and community resources, including how to set up support groups and offer social support.
12. Discuss cultural differences and PMADs.
13. Discuss spirituality and PMADs.

Should we stop administering the influenza vaccine to pregnant women?

Publish date: October 9, 2017
Author(s): Patrick Duff, MD

Author and Disclosure Information
Dr. Duff is Associate Dean for Student Affairs and Professor of Obstetrics and Gynecology in the Division of Maternal-Fetal Medicine, Department of Obstetrics and Gynecology, University of Florida College of Medicine, Gainesville.
The author reports no financial relationships relevant to this article.

Q. Should we stop administering the influenza vaccine to pregnant women?
A. No. Although a recent case-control study involving 485 cases found that the odds ratio of spontaneous abortion in women who received the pH1N1 vaccine (a vaccine that differs from the current quadrivalent vaccine) 2 years in a row was 6.5, compared with 1.3 in women who were not vaccinated with the pH1N1 vaccine in 2 consecutive seasons, more research is needed. ACOG and the CDC advise the continued practice of routinely offering the influenza vaccine to virtually all pregnant women at the beginning of the flu season.
